WARSAW MARATHON

Environmental Report
WARSAW JULY 2024

RUNNING FOR CLEAN AIR

DISCLAIMER

This report contains data from the Air Quality monitoring station installed at Park Pole Mokotowskie, Warsaw, POLAND, operating since May 7th, 2024.

The data presented in this report is collected with sensor technologies which are not regulatory-grade instrumentation following Directive 2008/50/EC. Therefore, the results presented should be considered as informative and not be used for regulatory compliance checking purposes. Any communication of the data should include this statement. After deployment, the monitors are not routinely inter-compared with reference instruments at each destination.

MAIN POLLUTANTS MEASURED

Nitrogen Dioxide

Primarily gets in the air from the burning of fuel by cars, trucks and buses, power plants

Ozone

Created by chemical reactions between (NO_x) and (VOC) in the presence of sunlight

Particulate matter

Mixture of solid particles and liquid droplets found in the air. Some are emitted directly from a source, such as heating in residential, construction sites, unpaved roads, fields, smokestacks, fires or transported by the wind

TO BUILD A SIMPLIFIED AIR QUALITY INDEX (AQI)

Gaseous pollutants

Particulate Matter

EUROPEAN AQI INDEX

Help us understand data measured by the stations

EXTREMELY POOR 126-200	May cause respiratory issues in healthy people, and serious health issues in people with lung/heart disease.
VERY POOR 101-125	The pollution level has reached a critical level. Even healthy people may show symptoms for short exposures.
POOR 75-100	Effects can be immediately felt by individuals at risk. Everybody feels the effects of prolonged exposure.
MODERATE 51-75	The air has reached a high level of pollution. Higher than the maximum limit for 24 hours established by WHO.
FAIR 26-50	The air is moderately polluted. A long-term exposure constitutes a health risk.
GOOD 0-25	The air is pure, ideal for outdoor activities.

EUROPEAN AQI LEVELS

Measurements of up to five key pollutants (O₃, NO₂, SO₂, PM₁₀, PM_{2.5}) determine the index level that describes the current air quality situation at the location of each Kunak device. The index corresponds to the poorest level for any of the five pollutants based on the following scheme:

Pollutant	Level index (based on pollutant concentrations in µg/m ³)					
	Good	Fair	Moderate	Poor	Very poor	Extremely poor
	(0-25)	(26-50)	(51-75)	(76-100)	(101-125)	(126-200)
PM _{2.5} (24h)	0-10	10-20	20-25	25-50	50-75	75-800
PM ₁₀ (24h)	0-20	20-35	35-50	50-100	100-150	150-1200
NO ₂	0-40	40-90	90-120	120-230	230-340	340-1000
O ₃	0-50	50-100	100-130	130-240	240-380	380-800
SO ₂	0-100	100-200	200-350	350-500	500-750	750-1250

RECOMMENDED AIR QUALITY GUIDELINES LEVELS & INTERIM TARGETS

Pollutant	Averaging time	Interim target				AQG level
		1	2	3	4	
PM _{2.5} , µg/m ³	Annual	35	25	15	10	5
	24-hour ^a	75	50	37.5	25	15
PM ₁₀ , µg/m ³	Annual	70	50	30	20	15
	24-hour ^a	150	100	75	50	45
O ₃ , µg/m ³	Peak season ^b	100	70	-	-	60
	8-hour ^a	160	120	-	-	100
NO ₂ , µg/m ³	Annual	40	30	20	-	10
	24-hour ^a	120	50	-	-	25

AIR QUALITY GUIDELINES FOR NITROGEN DIOXIDE (SHORT AVERAGE TIME) REMAIN VALID

Pollutant	Averaging time	Air quality guidelines that remain valid
NO ₂ , µg/m ³	1-hour	200

Recommended 2021 AQG levels compared to 2005 air quality guidelines

Pollutant	Averaging Time	2005 AQGs	2021 AQGs
PM _{2.5} , µg/m ³	Annual	10	5
	24-hour ^a	25	15
PM ₁₀ , µg/m ³	Annual	20	15
	24-hour ^a	50	45
O ₃ , µg/m ³	Peak season ^b	-	60
	8-hour ^a	100	100
NO ₂ , µg/m ³	Annual	40	10
	24-hour ^a	-	25
SO ₂ , µg/m ³	24-hour ^a	20	40
CO, mg/m ³	24-hour ^a	-	4

AGGREGATED DATA July 1st to July 31st

ENVIRONMENTAL DATA & AIR QUALITY INDEX

DEVICE LOCATED AT

Park Pole Mokotowskie

TEMPERATURE & HUMIDITY – Time variation - July 1st to July 31st

Air Temperature

Aggregated data of the temperature hourly evolution indicate that the lowest temperature is measured at 06:00 and the highest between 15:00 and 17:00

Relative Humidity

Aggregated data of the humidity hourly evolution indicate that the lowest humidity is measured at 17:00 and the highest at 06:00

WET BULB GLOBE TEMPERATURE - Time variation - July 1st to July 31st

WBGT is a measure of heat stress in direct sunlight.

It is a comprehensive measure of all the weather-related factors

(i) air temperature;

(ii) humidity;

(iii) wind speed;

(iv) solar radiation

that impact the health and performance of athletes.

WBGT - Time variation July 1st to July 31st

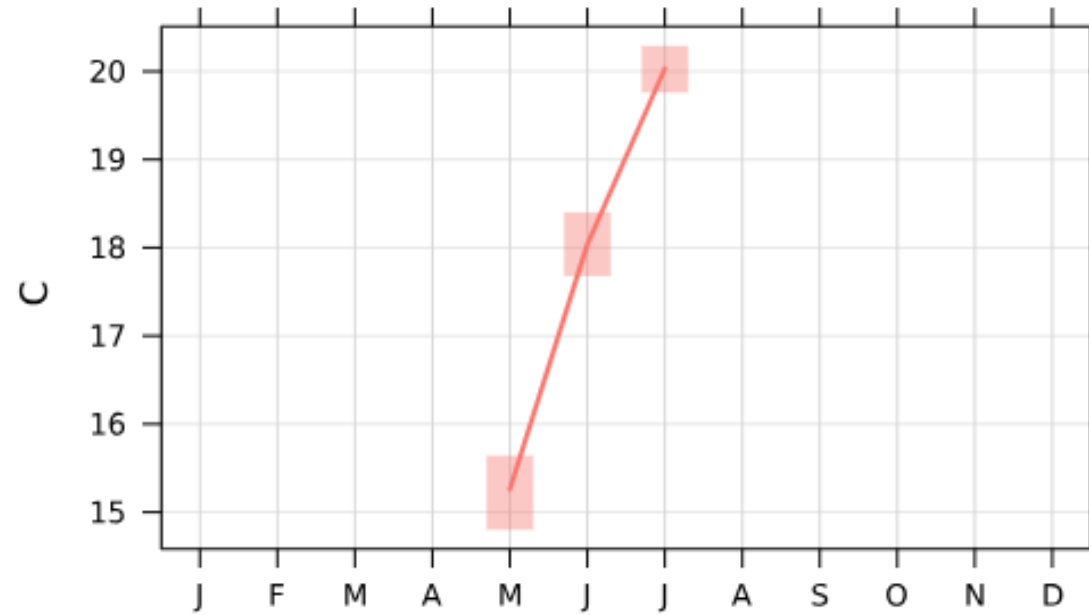

WBGT index during this period represents a significant level of heat stress for training athletes.

WBGT

Almost safe <21°C	Caution 21-25°C	Warning 25-28°C	Severe warning 28-30°C	Danger > 30°C
-------------------	-----------------	-----------------	------------------------	---------------

WBGT evolution from May to July

WBGT - K-A3 WA PRO 8 WARSAW

AQI EU - July 1st to July 31st

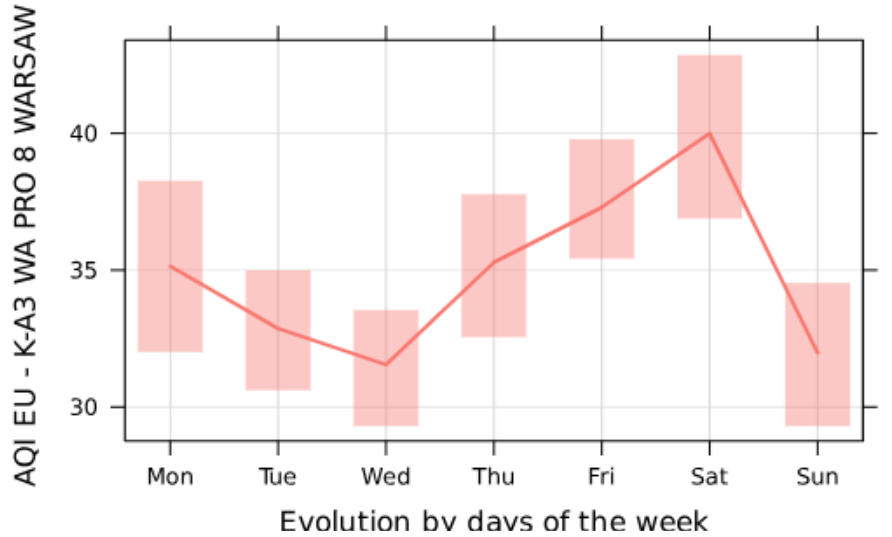

AQI EU of K-A3 WA PRO 8 WARSAW in 2024

July-2024						
30	38	40	30	41	43	40
40	52	44	51	78	78	63
44	71	67	54	50	44	72
70	81	50	54	45	47	76
49	35	42	30	1	2	3
4	5	6	7	8	9	10
S	M	T	W	T	F	S

The AQI calendar plot indicates the AQI for each day during the monitoring period. Helping us to have a first glimpse of the conditions for each day. The AQI measured in July shows a fair to poor air quality. The worst and best AQI values reported over the period are (81) and (30) respectively.

AQI - Time variation - July 1st to July 31st

Aggregated data of the AQI evolution throughout the monitoring period helps us understand how the AQI changed based on day of the week and time of the day.

Aggregated data of the evolution by days of the week indicates the lowest AQI values were recorded on Wednesday and Sunday this month.

Aggregated data of the AQI hourly evolution indicates the lowest AQI values during nights and mornings, and highest AQI values during early afternoon between 13:00 and 16:00

PARTICULATE MATTERS - Time variation - July 1st to July 31st

Aggregated data of the particulates pollutants evolution by days of the week indicates that absolute concentrations were higher on Thursday.

Guideline values

Coarse particulate matter (PM₁₀): 45 $\mu\text{g/ m}^3$ 24-hour mean

Fine particulate matter (PM_{2.5}): 15 $\mu\text{g/ m}^3$ 24-hour mean

PARTICULATE MATTERS - Time variation - July 1st to July 31st

PM₁₀ - K-A3 WA PRO 8 WARSAW

PM_{2.5} - K-A3 WA PRO 8 WARSAW

Aggregated data of the particulates pollutants hourly evolution show a moderate levels. PM_{2.5} and PM₁₀ showed higher concentrations at early morning from 04:00 to 7:00. These organic compounds can be emitted by both natural sources, such as trees and vegetation, as well as from man-made (anthropogenic) sources, such as industrial processes and motor vehicle exhaust. In this situation, both hypotheses are likely.

Guideline values

Coarse particulate matter (PM₁₀): 45 µg/ m³ 24-hour mean

Fine particulate matter (PM_{2.5}): 15 µg/ m³ 24-hour mean

GASEOUS POLLUTANTS - Time variation - July 1st to July 31st

NO₂ GCc - K-A3 WA PRO 8 WARSAW

NO GCc - K-A3 WA PRO 8 WARSAW

O₃ GCc - K-A3 WA PRO 8 WARSAW

Aggregated data of the gaseous pollutants evolution by days of the week indicates that absolute concentrations were relatively low for NO₂, NO. O₃ shows constant values at a relatively higher levels.

Aggregated data of the gaseous pollutants hourly evolution do not show any typical trends for NO₂ and NO suggesting a very low influence of vehicle traffic emissions (morning and evening rush hours) in this location. O₃ peaked in the early afternoon between 14:00 and 16:00. Typically, ozone levels reach their peak in mid-afternoon, after exhaust fumes from morning rush hour have had time to react in sunlight.

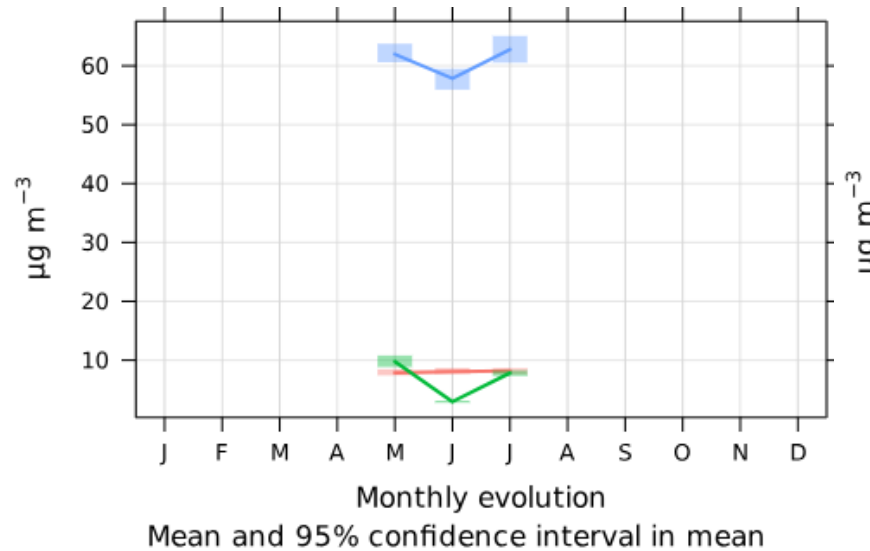

Guideline values NO₂
25 µg/m³ (24h)
200 µg/m³ 1-hour mean

Guideline values O₃
100 µg/m³ 8-hour mean

PM₁₀ PM_{2.5}

CONCLUSIONS

Air Quality Index values recorded during the month of July shows a fair to poor levels of air pollution. AQI index was largely influenced by Ozone levels.

WBGT index increases during this period and represents a significant level of heat stress for training athletes.

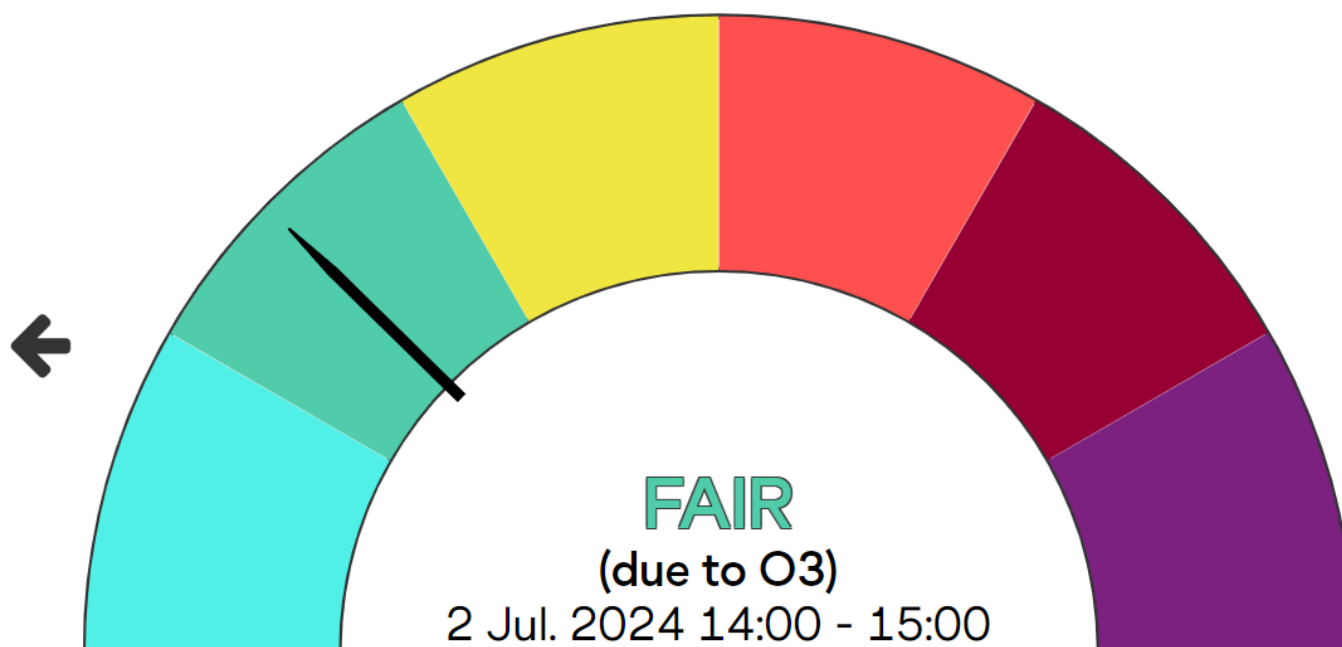

Aggregated data of the gaseous pollutants hourly evolution indicates typical trends for NO₂ and NO do not show any typical trends suggesting a very low influence of vehicle traffic emissions (morning and evening rush hours) in this location. Ozone levels reached their peak in the early/mid-afternoon, after exhaust fumes from morning rush hours have had time to react to the sunlight.

Aggregated data of the particulates pollutants hourly evolution show a moderate to poor levels. PM_{2.5} and PM₁₀ showed higher concentrations at early morning, These organic compounds can be emitted by both natural sources, such as trees and vegetation, as well as from man-made (anthropogenic) sources, such as industrial processes and motor vehicle exhaust. In this situation, both hypotheses are likely.

AQI level is improving compared with previous months.

An abstract graphic on a teal background. A central black shape, resembling a stylized letter 'A' or a fan, is surrounded by numerous black lines radiating outwards in all directions, creating a sunburst or starburst effect. The lines vary in length and angle, some pointing towards the top corners and others towards the bottom corners.
